

Now introducing: Tri-Flex

For Hippo Sak™

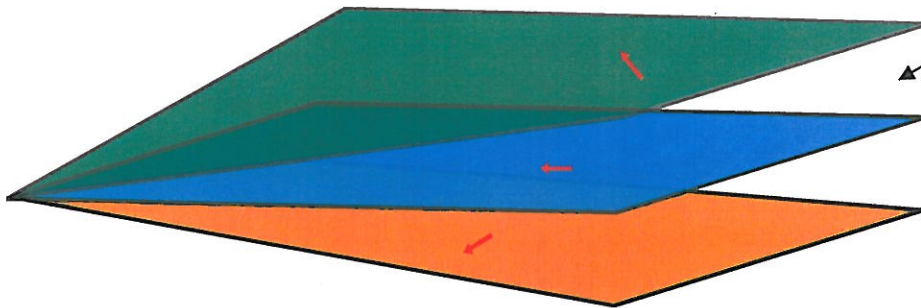

Flexibility and Strength in 3 layers

Years of Research & Development has allowed Crown Poly to come up with a unique Proprietary Blend of super strong film for Hippo Sak! This blend allows for down gauging which helps our environment via source reduction, and our film is stronger than higher gauge commodity bags.

Tri-Flex fuses together three different blends of film to create one strong film, similar to the concept of plywood

- Plywood is three layers of thin wood glued with its grain running perpendicular to the layer above it creating one strong layer of wood. It is stronger than one layer of wood of the same thickness or even thicker.

- Each of the three different layers has strength molecules facing different directions which provide flexibility and strength.

- Reduces bag usage by 25% or more
- No need to double bag
- Will not tear, leak or get holes
- 100% recyclable
